Welcome aboard the new age airports!

Moroccan Airports Authority (ONDA) launched in September 2011 an IT application called "Smart Airport" dedicated to airport management. Operating by now in 22 national airports, this program collects in real time data covering all of the airports' activities and services network: issues of safety, security, quality and running terminals facilities.

Advanced standards

By implementing and deploying Smart Airport application, Moroccan Airports Authority aims at improving the efficiency and the reactivity of the airport services provided to the users. The program allows as well the introduction in all the Moroccan airports the "Airport Collaborative Decision Making" concept, recommended by the aircraft industry for the modern airports management. Besides, the Smart Airport application fits into the ICAO "Aviation System Block Upgrades" recommendations.

The screenshot displays a software interface with a sidebar on the left containing various icons. The main area features a table with the following columns: 'Airport', 'Type', 'Status', 'Priority', 'Status', 'Passenger', 'Status', 'Status', 'Status', 'Status', 'Status'. The table contains multiple rows of data, each starting with a small icon in the first column. The data appears to be organized into several sections, possibly representing different airports or operational units.

Destination: high-efficiency

Completely secured and modular, the Smart Airport application interconnects more than 390 users so as they can share information on all the airport operations relating to passengers' handling, by supervising the quality of the services provided as well as the smooth running of the terminal's facilities.
